## chem-bla-ics

Rich just posted an interesting read on [Web-Centric Science](#), after a [gauntlet thrown down](#) by [The Realm of Organic Synthesis](#) (TROS).

I agree that this still is a problem: where can (organic) chemists host their data? TROS hints at [Wikipedia](#), but an encyclopedia is not always the most suited place for cutting edge chemistry (article can easily be biased, contain (science) political views, etc...). I would suggest a blog would be a good start, and if proper markup would be used services like [Chemical blogspace](#) would automatically aggregate it.

However, something less volatile might be interesting. So, what we need is an overview of web databases where experimental chemistry data can be hosted. I'll start one, and annotate resources with license, on [delicious.com](#), using the tags [chemistry](#) [+web](#) [+database](#) [+open](#) [+submission](#), and regularly summarize things here.

In the below table, the last column indicated the most liberal license you can use to host your data:

database	data type	license
<a href="#">NMRShiftDB</a>	NMR spectra	<a href="#">GNU FDL</a>
<a href="#">ChemSpider</a>	Structures, links to papers, spectra	<a href="#">open data</a>
<a href="#">SORD</a>	Organic Reactions	?

There are some obvious gaps here, if you consider a typical experimental section. What to do with an measure melting point, IR spectra, mass spectral information, and measured elemental composition.
