Did others notice this too? The [blogger.com](#) *Links to this post* functionality seems seriously broken... once a rather useful feature, it has now degraded to a useless state:

The screenshot shows a Blogger post page. At the top, there are two small downward-pointing arrows. Below them is a box containing the text "Labels: [4-hydroxybenzaldehyde](#), [solubility](#), [THF](#)". Underneath this is a timestamp and a comment count: "posted by Jean-Claude Bradley @ [Thursday, February 12, 2009](#) [0 comments](#) [links to this post](#)". A section titled "0 Comments:" follows, with a link to "Post a Comment". Below that is a section titled "Links to this post:" with a single entry: "► [The Tree of Life: McCain Palin going after fruit flies](#) [Create a Link](#)".

I'm quite sure a post of [last October](#) cannot link to the [Substructure searching on ONS solubility data](#) item Jean-Claude posted today.
