Abstract

Because I wanted to test internet telephony I downloaded Skype and tried to get it to work on my Kubuntu system. Unfortunately, the Skype version is only 1.2.0.18, and it does not work well with arts :(That is, using artsdsp it crashes with segfaults whenever I start even a chat, let alone a phone call. This could be worked around by disabling sound in my KDE session, and then the `/dev/dsp` is open again.

Because I wanted to test internet telephony I downloaded [Skype](#) and tried to get it to work on my [Kubuntu](#) system. Unfortunately, the Skype version is only 1.2.0.18, and it does not work well with `arts` :(That is, using `artsdsp` it crashes with segfaults whenever I start even a chat, let alone a phone call. This could be worked around by disabling sound in my KDE session, and then the `/dev/dsp` is open again.

Better even, I bought a USB telephone yesterday: a reasonably cheap [Tiptel 115](#), with [Skype support](#). Kubuntu breezy recognized the USB device, added a `/dev/dsp1` and after running `alsamixer` to raise the sound levels, it seems to work fine, though did not have an actual phone call yet :) I enabled KDE sound again, which is in the first device, and Skype runs on the second. No more segfaults it seems.
