Git, Cdk

Abstract

Some of you heard me complain about commit messages resulting from git cherry-pick which allows me to apply patches from CDK trunk to a branch, without needing to do a full merge of what happens in trunk. The commit messages would be identical, which made it seem that those original messages were mine.

chem-bla-ics

Some of you heard me complain about commit messages resulting from `git cherry-pick` which allows me to apply patches from [CDK trunk](#) to a branch, without needing to do a full merge of what happens in trunk. The commit messages would be identical, which made it seem that those original messages were mine.

However, this is how I can modify those messages:

```
$ git commit --amend
```

This allows me to convert a mere *refactored a method* into *Applied patch from trunk (rev 12479): [shk3] refactored a method*.
