[Bioclipse](#) 1.0 is to be released in May, and the cartoon on script command is still not working in the [Jmol](#) viewer. For those who do not know yet, [Bioclipse](#) is a cool Eclipse RCP based Java chemo-and bioinformatics workbench. To have a better idea what goes on inside Bioclipse, I wrote a new BioPolymer tree to show me the strands in the protein. After [Ola](#) wrote code to show properties for IChemObject's, I extended it with PDB properties for the atoms, strands and monomers.

The contents of the ChemTree view in the middle and the Properties view below that look fine:

So I'll have to dig a bit further.
