## Keywords

Pfas, Chemistry, Fair, Scholia, Wikidata

## Abstract

A recent report by the Dutch RIVM, PFAS in the blood of the Dutch population (doi:10.21945/RIVM-2025-0094), writes that seven PFAS compounds are found in blood samples of all tested people. Another nine compounds are found in at least 1-in-10 people. Because there is relevant data in the report on the 28 studied PFAS compound, I wanted to have the report more FAIR than it is on the website. Why this report?

## chem-bla-ics

A recent report by the Dutch [RIVM](#), *PFAS in the blood of the Dutch population* (doi:[10.21945/RIVM-2025-0094](#)), writes that seven [PFAS](#) compounds are found in blood samples of all tested people. Another nine compounds are found in at least 1-in-10 people. Because there is relevant data in the report on the 28 studied PFAS compound, I wanted to have the report more FAIR than it is on the website. Why this report? Well, the chemistry and the history is fascinating and brutal (I like [this Veritasium video](#)).

The history tells me that our society may sound woke and leftish, in reality it is a continuous fight for basic human rights. (Something that plenty have been saying for years.) In this case, a healtht life is the human right.

So, what can I do to make this report more FAIR?

## Findable in Wikidata

Since this report has been [mentioned in the news](#), it clearly is notable. The simplest thing to do is thus to just add it [Wikidata](#). Because the DOI of the report had not been recorded yet, I could not let [Scholia](#) do it for me. But doing it manually is only a bit more work: [Q135222054](#). The provided metadata [on the RIVM website](#) is minimal.

But we can do more. Particularly, because I want people to find this report when they look info knowledge about the 28 studied chemicals, I added [main subject](#) annotation using the information in *Table 1* in the report. Using [Scholia](#) and the CAS registry number in the table, I crosscheck the information in Wikidata is consistent with the report (and visa versa). It was. I then added the Dutch name and acronym for most of them. Some already had the name as in the Table. That gives us a nice “Topic scores” plot for [the Scholia page of the report](#):

## PFAS in Dutch population (Homo sapiens)

---

Egon Willighagen

Found in 100% of the tested population

PFOA
PFNA
PFDA
PFUnDA
PFHxS
PFHpS
PFOS

Found in 10-99% of the tested population

PFPeA
PFHpA
PFDoDA
PFBS
PFPeS
8:2 FTS
MeFOSAA
EtFOSAA
9Cl-PF3ONS

Each *metabolite* here is annotated with their Wikidata identifier, allowing us to map experimental data on top of it. And we get links out to other databases almost for free:

Found in 100% of the tested po

**PFOA**

PFOA
PFNA
PFDA
PFUnDA
PFHxS
PFHpS
PFOS

And the link to Wikidata actually links to Scholia, so for the PFOA in the above example, we can quickly see the boiling point, decomposition point, and melting point of this PFAS. And literature with undoubtedly even more knowledge about this PFAS:

## Publications per year

More details on literature about this chemical can found found on the [topic aspect page](#).

## chem-bla-ics

Now, these two steps were mostly manual: drawing [WP5579](#) in WikiPathways and adding the report annotations (*main subject* and *cites*) in Wikidata.

## Findable in the VHP4Safety Compound Wiki

As part of the VHP4Safety project, I am collecting information on chemicals studied in the context of toxicology, safety, and risk assessment. Often specific collections of compounds studied as a whole. This report is such a collection and provides experimental data on these compounds. So, I want this report to be findable for the [VHP4Safety Compound Wiki](#) too. Creating the collection is a manual step: [Q5145](#).

Now, because both Wikidata and our VHP4Safety Compound Wiki (a Wikibase instance) are semantic and support, I can use SPARQL to create instructions to link the 28 compounds to the new collection. Now, arguably, that can be done manually too, and maybe faster, for larger collections this is harder. So, I dug up [my earlier notes](#) and got some useful things together.

This query lists all 28 PFAS linked to the report [in Wikidata](#):

```
SELECT ?pfas ?pfasLabel WHERE {
  wd:Q135222054 wdt:P921 ?pfas .
  ?pfas wdt:P31 wd:Q113145171 .
  SERVICE wikibase:label { bd:serviceParam wikibase:language "[AUTO_LANGUAGE],mul,en". }
}
```

Using federation powers, I can use this for [a SPARQL query](#), and return the results in QuickStatements that say *this VHP compound is part of the VHP collection*:

```
PREFIX wb: <https://compoundcloud.wikibase.cloud/entity/>
PREFIX wbt: <https://compoundcloud.wikibase.cloud/prop/direct/>

SELECT (SUBSTR(STR(?cmp),45) AS ?qid) ?P21 WHERE {
  ?cmp wbt:P5 ?wikidata .
  SERVICE <https://query.wikidata.org/sparql> {
    wd:Q135222054 wdt:P921 ?pfas .
    ?pfas wdt:P31 wd:Q113145171 .
    BIND (substr(str(?pfas),32) AS ?wikidata)
  }
  BIND ("Q5145" AS ?P21)
}
```

I actually had to add 5 PFAS compounds in the VHP4Safety Compound Wiki first. That follows the [same procedure for how I have been adding chemical compounds to Wikidata](#) (see also [this preprint](#)). The input `cas.smi` has the (missing) SMILES, Wikidata QID, and English label:

C(CS(=O)(=O)O)C(C(C(C(C(C(F)(F)F)(F)F)(F)F)(F)F)(F)F)(F)F)(F)F	Q27063662	6:2 Fluor
CN(CC(=O)O)S(=O)(=O)C(C(C(C(C(C(F)(F)F)(F)F)(F)F)(F)F)(F)F)(F)F)(F)F	Q126605979	MeFHxSAA

## chem-bla-ics

<chem>CN(CC(=O)O)S(=O)(=O)C(C(C(C(F)(F)F)(F)F)(F)F)(F)F</chem>	Q126682412	MeFBSAA
<chem>C(=O)(C(C(F)(F)F)(F)OC(C(C(F)(F)F)(F)F)(F)F)O[H]</chem>	Q29387971	2,3,3,3-tetrafluoro-4-(2,2,2-trifluoroethyl)butanoic acid
<chem>C(C(C(=O)O)(F)F)(OC(C(C(OC(F)(F)F)(F)F)(F)F)(F)F)F</chem>	Q81981675	4,8-Dioxa-3H-perfluorooctanoic acid

For reference, this is the command line I used to create QuickStatement instructions:

```
groovy createWDitemsFromSMILES.groovy -w compoundcloud.wikibase.cloud -c Q2368 -d P5 -l -
```

## Final remark

Are these 16 the only PFAS in our body? With 28 studied out of [a potential seven million](#), I doubt it.
