chem-bla-ics

Mix one of the oldest and one of the latest computer technologies, and you get [FoX](#) (BSD license), a [Fortran](#) library for reading and writing [Chemical Markup Language](#), and thus [XML](#). Amazing, what Toby White achieved, though he did not start from scratch: *“FoX evolved from the initial codebase of [xmlf90](#), which was written largely by Alberto Garcia and Jon Wakelin.”* (source: [cml-discuss mailing list](#)).
