Abstract

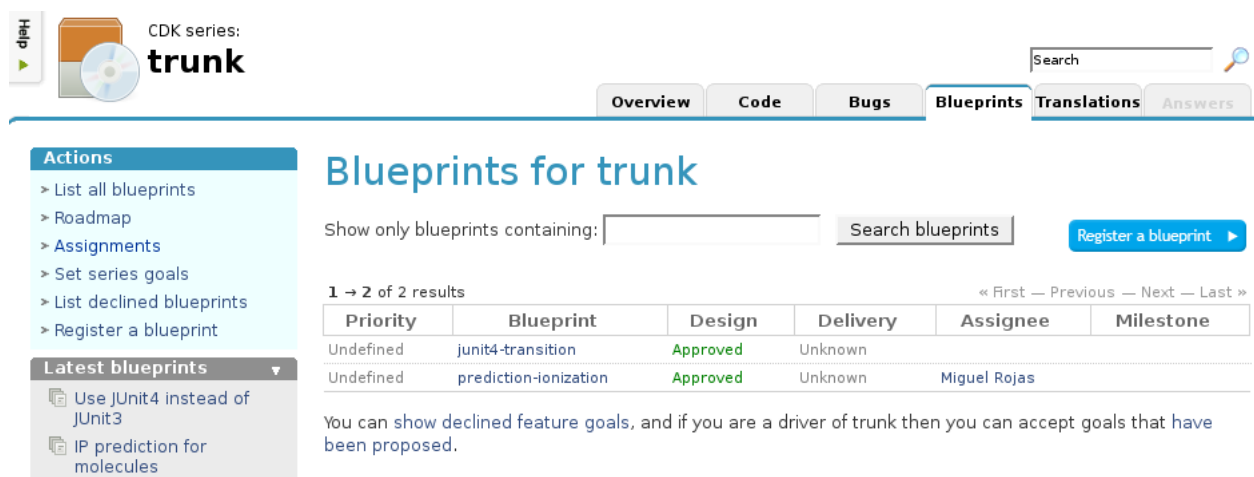

Today, Miguel (who made the 10000th CDK commit) and I gave LaunchPad a go, because it offers a nice GUI for planning and monitoring source code development. We have set up a CDK team and a CDK project. LaunchPad has overlap with SourceForge functionality, but the idea is not to duplicate functionality. Moreover, we do not translate the CDK either, so that LaunchPad functionality is not useful either. Not for the CDK at least;

Today, Miguel (who made [the 10000th CDK commit](#)) and I gave [LaunchPad](#) a go, because it offers a nice GUI for planning and monitoring source code development. We have set up a [CDK team](#) and a [CDK project](#). LaunchPad has overlap with [SourceForge](#) functionality, but their idea is not to duplicate functionality. Moreover, we do not translate the CDK either, so that LaunchPad functionality is not useful either. Not for the CDK at least; maybe for [Jmol](#) and [Bioclipse](#)?

However, we are interested in the task management system of LaunchPad. While the CDK project is currently maintaining a [Project Maintenance Tasks](#) tracker, it does not have the feature richness of the LaunchPad equivalent. The latter allows us to link tasks with series goals. We currently basically have two series: the `cdk1.0.x/` branch, and `trunk`. Miguel and I have been working on getting the [ionization potential prediction](#) in `trunk` working, which involves about all the code Miguel wrote during his PhD thesis with [Christoph](#). And, this is one of the goals of the next stable CDK series (replacing the 1.0.x series). This is something we can easily define in LaunchPad:

CDK series: **trunk**

Blueprints for trunk

Show only blueprints containing:

1 → 2 of 2 results

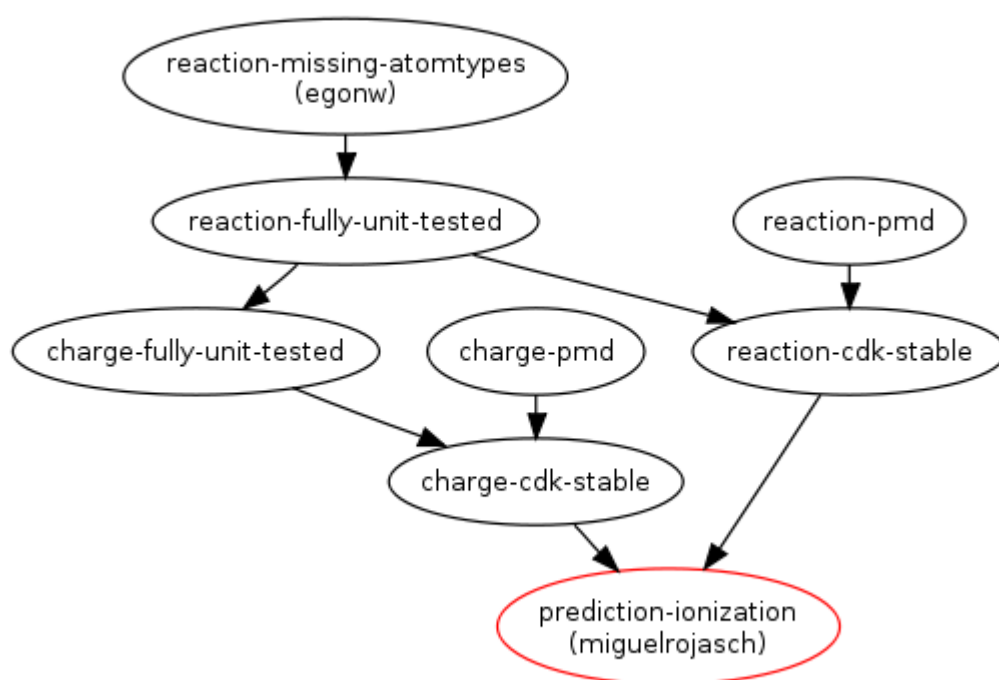

Priority	Blueprint	Design	Delivery	Assignee	Milestone
Undefined	unit4-transition	Approved	Unknown		
Undefined	prediction-ionization	Approved	Unknown	Miguel Rojas	

You can show declined feature goals, and if you are a driver of trunk then you can accept goals that have been proposed.

Getting the IP-prediction code updated for the new CDK atom types and other changes, and making it CDK stable involved quite a long list of tasks, which shows dependencies. For example, I can't continue [cleaning up the partial charge prediction code](#), before the [resonance structure generator in the reaction module](#) is working properly again. This in turn depends on me adding missing radical and charge atom types, which in turn depends on expected atom types, which Miguel had to implement. And this last is actually what he was committing around the 10000th commit.

Now, Miguel and I will try to manage this development in `trunk` using LaunchPad. It allows us to define all these smaller tasks, but, more importantly, the dependencies between them:

Dependency tree

* Blueprints in grey have been implemented.

As such, LaunchPad gives us the means to manage this complex development. It shows up what we're facing, how far we have progressed, and much, much more:

This goes well beyond what SourceForge has to offer; this will be an interesting experiment. I do not anticipate dropping SourceForge at all (just in case you were wondering...); they have served as generally very, very well; and completely free too! (LaunchPad is free too) As far as I can see, they form a perfect complement. Like a ligand and an enzyme, like opensource and [open notebook science](#), or like a Mammoth and an ice field.

Speaking about ONS... [Jean-Claude](#), not sure if LaunchPad would be open to projects without source code too...
